# Safety Instructions

These safety instructions are intended to prevent hazardous situations and/or equipment damage. These instructions indicate the level of potential hazard with the labels of “**Caution**,” “**Warning**” or “**Danger**.” They are all important notes for safety and must be followed in addition to International Standards (ISO/IEC)<sup>\*1)</sup>, and other safety regulations.

\*1) ISO 4414: Pneumatic fluid power - General rules and safety requirements for systems and their components  
ISO 4413: Hydraulic fluid power - General rules and safety requirements for systems and their components  
IEC 60204-1: Safety of machinery - Electrical equipment of machines - Part 1: General requirements  
ISO 10218-1: Robots and robotic devices - Safety requirements for industrial robots - Part 1: Robots  
etc.

## **Danger**

**Danger** indicates a hazard with a high level of risk which, if not avoided, will result in death or serious injury.

## **Warning**

**Warning** indicates a hazard with a medium level of risk which, if not avoided, could result in death or serious injury.

## **Caution**

**Caution** indicates a hazard with a low level of risk which, if not avoided, could result in minor or moderate injury.

## **Warning**

### **1. The compatibility of the product is the responsibility of the person who designs the equipment or decides its specifications.**

Since the product specified here is used under various operating conditions, its compatibility with specific equipment must be decided by the person who designs the equipment or decides its specifications based on necessary analysis and test results. The expected performance and safety assurance of the equipment will be the responsibility of the person who has determined its compatibility with the product. This person should also continuously review all specifications of the product referring to its latest catalog information, with a view to giving due consideration to any possibility of equipment failure when configuring the equipment.

### **2. Only personnel with appropriate training should operate machinery and equipment.**

The product specified here may become unsafe if handled incorrectly. The assembly, operation and maintenance of machines or equipment including our products must be performed by an operator who is appropriately trained and experienced.

### **3. Do not service or attempt to remove product and machinery/equipment until safety is confirmed.**

1. The inspection and maintenance of machinery/equipment should only be performed after measures to prevent falling or runaway of the driven objects have been confirmed.
2. When the product is to be removed, confirm that the safety measures as mentioned above are implemented and the power from any appropriate source is cut, and read and understand the specific product precautions of all relevant products carefully.
3. Before machinery/equipment is restarted, take measures to prevent unexpected operation and malfunction.

### **4. Our products cannot be used beyond their specifications. Our products are not developed, designed, and manufactured to be used under the following conditions or environments. Use under such conditions or environments is not covered.**

1. Conditions and environments outside of the given specifications, or use outdoors or in a place exposed to direct sunlight.
2. Use for nuclear power, railways, aviation, space equipment, ships, vehicles, military application, equipment affecting human life, body, and property, fuel equipment, entertainment equipment, emergency shut-off circuits, press clutches, brake circuits, safety equipment, etc., and use for applications that do not conform to standard specifications such as catalogs and operation manuals.
3. Use for interlock circuits, except for use with double interlock such as installing a mechanical protection function in case of failure. Please periodically inspect the product to confirm that the product is operating properly.

# Safety Instructions

## Caution

**We develop, design, and manufacture our products to be used for automatic control equipment, and provide them for peaceful use in manufacturing industries.**

**Use in non-manufacturing industries is not covered.**

Products we manufacture and sell cannot be used for the purpose of transactions or certification specified in the Measurement Act.

The new Measurement Act prohibits use of any unit other than SI units in Japan.

## Limited warranty and Disclaimer/Compliance Requirements

The product used is subject to the following “Limited warranty and Disclaimer” and “Compliance Requirements”.

Read and accept them before using the product.

### Limited warranty and Disclaimer

1. The warranty period of the product is 1 year in service or 1.5 years after the product is delivered, whichever is first.\*2)

Also, the product may have specified durability, running distance or replacement parts. Please consult your nearest sales branch.

2. For any failure or damage reported within the warranty period which is clearly our responsibility, a replacement product or necessary parts will be provided.

This limited warranty applies only to our product independently, and not to any other damage incurred due to the failure of the product.

3. Prior to using SMC products, please read and understand the warranty terms and disclaimers noted in the specified catalog for the particular products.

**\*2) Vacuum pads are excluded from this 1 year warranty.**

A vacuum pad is a consumable part, so it is warranted for a year after it is delivered.

Also, even within the warranty period, the wear of a product due to the use of the vacuum pad or failure due to

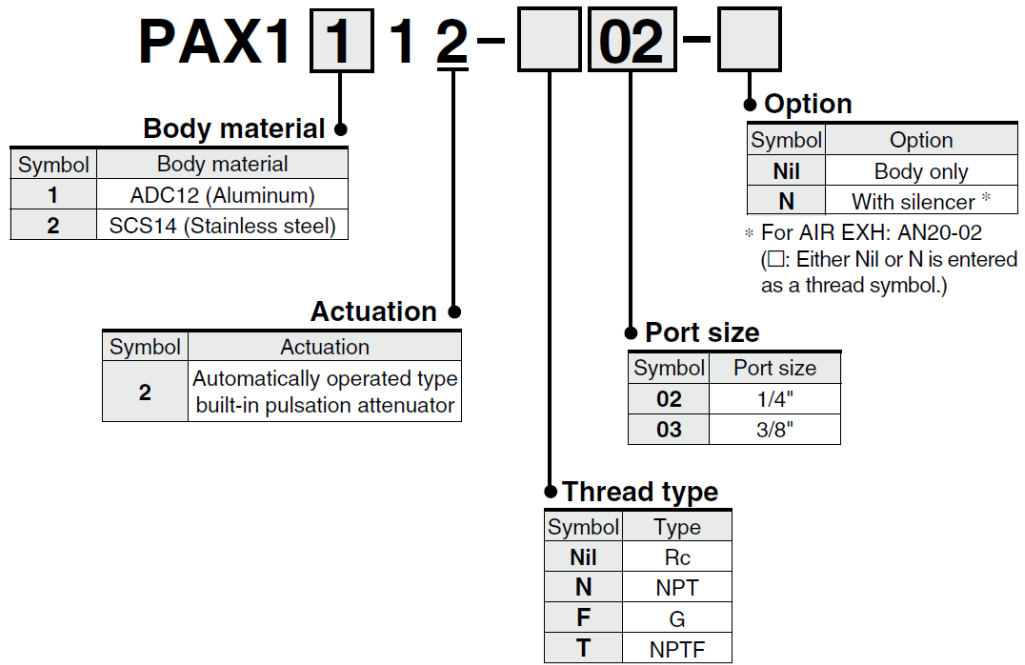

the deterioration of rubber material are not covered by the limited warranty

### Compliance Requirements

1. The use of SMC products with production equipment for the manufacture of weapons of mass destruction (WMD) or any other weapon is strictly prohibited.

2. The exports of SMC products or technology from one country to another are governed by the relevant security laws and regulations of the countries involved in the transaction. Prior to the shipment of a SMC product to another country, assure that all local rules governing that export are known and followed.

# Model Indication and How to Order

## Names and Functions of Product Parts

Description	Functions
Suction port (FLUID IN)	Sucks the fluid to be transferred. Connect suction piping.
Discharge port (FLUID OUT)	Discharges the fluid taken in the pump. Connect discharge piping.
Pilot air supply port (AIR SUP)	Supplies air of set pressure. Connect the air piping.
Pilot air exhaust port (AIR EXH)	Exhausts pilot air.
Reset button	Resets the pump when operation is stopped.

## Piping and Operation

### ⚠ Caution

Mounting posture of the pump is set with the reset button facing upward. Air to be supplied to the air supply port <AIR SUP> should be cleaned and filtered through AF filter, etc. Air with foreign matter or drainage etc. will have negative effects on the built-in directional control valve and will lead to malfunction. When air needs additional purification, use a filter (AF series), and a mist separator (AM series) together. Maintain the proper tightening torque for fittings and mounting bolts, etc. Looseness can cause problems such as fluid and air leaks, while over tightening can cause damage to threads and parts, etc.

#### Starting and Stopping

Refer to circuit example (1)

1. Connect air piping to the air supply port <AIR SUP> and connect piping for the fluid to be transferred to the suction port <FLUID IN> and the discharge port <FLUID OUT>.
2. Using a regulator, set the pilot air pressure within the range of 0.2 to 0.7 MPa. Then, the pump operates when power is applied to the 3 port solenoid valve of the air supply port <AIR SUP>, the sound of exhaust begins from the air exhaust port <AIR EXH> and fluid flows from the suction port <FLUID IN> to the discharge port <FLUID OUT>.

At this time, the throttle on the discharge side is in an open state. The pump performs suction with its own power even without priming. (Dry state suction lifting range: max. 2 m) To restrict exhaust noise, attach a silencer (AN20-02: option) to the air exhaust port <AIR EXH>.

3. To stop the pump, exhaust the air pressure being supplied to the pump by the 3 port solenoid valve of the air supply port <AIR SUP>. The pump will also stop if the throttle on the discharge side is closed.

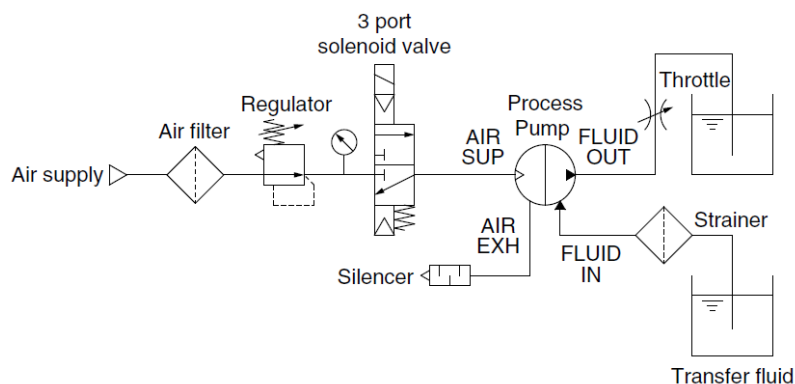

#### Discharge Flow Rate Adjustment

1. To adjust the flow rate from the discharge port <FLUID OUT>, use the throttle connected to the discharge side. Refer to circuit example (1). Note that this product cannot be used as a fixed quantity liquid dispense pump.
2. When operating with a discharge flow rate below the specification range, provide a by-pass circuit from the discharge side to the suction side to ensure the minimum flow rate inside the process pump. With a discharge flow rate below the minimum flow rate, the process pump may stop due to unstable operation. Refer to circuit example (2). (Minimum flow rates: 0.5 L/min)

#### Reset Button

When the pump stops during operation, press the reset button. This makes it possible to restore operation in case the switching valve becomes clogged due to foreign matter in the supply air. Maintenance is necessary if the reset button needs to be pressed frequently.

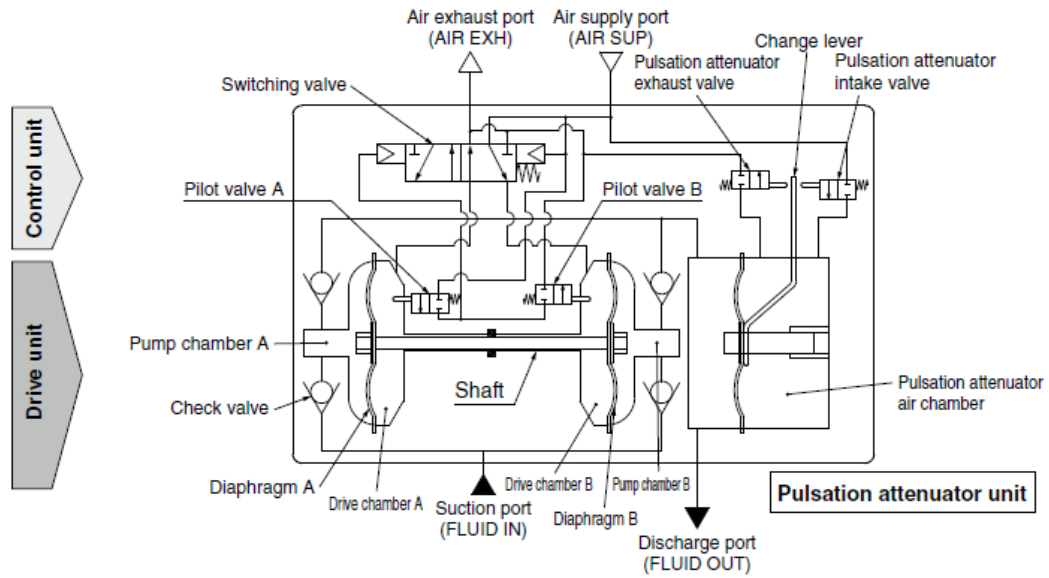

Circuit example (1)

Circuit example (2)

# Working Principle

## Control unit

1. When air is supplied, it passes through the switching valve and enters drive chamber B.
2. Diaphragm B moves to the right, and at the same time diaphragm A also moves to the right pushing pilot valve A.
3. When pilot valve A is pushed, air acts upon the switching valve, drive chamber A switches to a supply state, and the air which was in drive chamber B is exhausted to the outside.
4. When air enters drive chamber A, diaphragm B moves to the left pushing pilot valve B.
5. When pilot valve B is pushed, the air which was acting upon the switching valve is exhausted, and drive chamber B once again switches to a supply state. A continuous reciprocal motion is generated by this repetition.

## Drive unit

1. When air enters drive chamber B, the fluid in pump chamber B is forced out, and at the same time fluid is sucked into pump chamber A.
2. When the diaphragm moves in the opposite direction, the fluid in pump chamber A is forced out, and fluid is sucked into pump chamber B.
3. The pressure of the fluid that is forced out of the pump chamber is adjusted in the pulsation attenuation chamber and is then exhausted.
4. Continuous suction/discharge is performed by the reciprocal motion of the diaphragm.

## Pulsation attenuation chamber

1. Pulsation is attenuated by the elastic force of the diaphragm and air in the pulsation attenuation chamber.
2. When the pressure in the pulsation attenuation chamber rises, the change lever presses the pulsation attenuator intake valve, and air enters the pulsation attenuator air chamber.
3. Conversely, when pressure drops, the change lever presses the pulsation attenuator exhaust valve, exhausting the air from the air chamber and keeping the diaphragm in a constant position. Note that some time is required for the pulsation attenuator to operate normally.

# Precautions

## 1. Caution on Design

### Warning

#### 1. Confirm the specifications.

- Give careful consideration to operating conditions such as the application, fluid and environment, and use the product within the operating ranges specified in this catalog.
- The product is provided for physical, chemical and industrial equipment.

#### 2. Fluids

- When ignitable fluid is used, select a product with metal wetted parts (aluminum, stainless steel). Always take countermeasures against static electricity.
- For the compatibility between the materials composing the product and the fluids, check the compatibility check list. Since the compatibility of the fluid used may vary depending on its type, additives, concentration, temperature, etc., give sufficient consideration when selecting the material.
- Use within the range of the operating fluid temperatures.
- If foreign matter is mixed in the fluid, these may cause abrasion of the inside of the pump resulting in a problem. Use an appropriate filter (strainer) to remove them. In general, 80 to 100 mesh (150 to 180  $\mu$  m) filters are recommended.
- When transferring a coagulable liquid, take measures to prevent it from coagulating in the pump.
- Use of slurry is not recommended.
- Take countermeasures to prevent the operating fluid from getting onto the body of the process pump.

#### 3. Water hammer

If a valve is operated abruptly etc., a high pressure may be applied due to water hammer. Take measures to prevent pressures higher than specified from being applied.

<Examples of measures>

- Use a water hammer resistant valve to reduce the valve closing speed.
- Use an elastic piping material such as rubber hose or an accumulator to absorb the impact pressure.

#### 4. Liquid seals

To ensure that fluid does not become sealed inside the process pump, when stopping the pump, relieve the discharge pressure inside it. As shown in the figure at right, make a circuit which has a relief valve installed on the system.

#### 5. Fluid pressure supplied to the process pump

Feeding the fluid from the suction side into the pump under pressure, or drawing it using a negative pressure, will reduce the life of the pump.

#### 6. Ensure space for maintenance.

Secure the space required for maintenance and inspection. Take into consideration also leakage from the product. When transferring a flammable liquid or a liquid that may affect the human body or environment, take measures including fire ban and keeping the area off limits.

#### 7. When the diaphragm is broken, supply air will be mixed with the fluid or fluid will enter the air switching valve. When the supply air or debris contained in it affect the product performance, or the supply air is not suitable for the chemical resistance of the components, countermeasures need to be taken by the customer.

#### 8. Use a design which prevents reverse pressure and reverse flow.

If reverse pressure or reverse flow occurs on the discharge side of the process pump, the equipment is liable to become damaged or malfunction. Take safety measures in designing the circuit.

#### 9. Measures against static electricity

Take measures against static electricity as static electricity may occur depending on the fluid. Particularly, when circulating flammable fluid through the pump, be sure to take measures to prevent the occurrence of static electricity.

#### 10. The pump cannot transfer gas. Do not allow it to idle for a long time.

If the pump is operated for a long time without any fluid inside or in a gas-fluid mixed state, the diaphragm may be damaged or the life may be shortened. Dry operation is only allowed during self-priming.

## 11. Condensation and freezing of the pilot port

The location around the switching valve and the air exhaust port can cool down quickly due to expansion of the supply air, and this may cause condensation on the piping and the condensation may freeze during operation in winter. Take measures to ensure that water droplets from condensation are not splashed onto any electric parts or equipment.

### Caution

#### 1. Suspension of the pump operation

Use a 3-port solenoid valve and be sure to discharge the residual pressure. If the process pump is stopped while air is still being supplied to it, a load will be applied to the internal parts of the pump, reducing the life of the pump. Also, if the pump should stop while consuming the residual pressure, the built-in pilot air switching unit may become unstable and unable to be restarted. If it cannot be restarted, press the reset button.

#### 2. Use the constant pilot air pressure.

The automatically operated type of some models adopts an air spring for the built-in air control circuit, and the pump may malfunction and stop when the pilot air pressure fluctuation exceeds 50 kPa.

#### 3. Reverse flow

The check valve inside the process pump does not completely stop reverse flow (the flow from the discharge side to the suction side). For this reason, fluid may sometimes flow from the discharge side to the suction side when the pump is stationary, etc). As a countermeasure, install a 2-way valve or a check valve. However, please note that when a check valve is installed, if the cracking pressure is high, defective suction may occur. (As a guide, the cracking pressure should be 0.02 MPa or less.)

## 2. Mounting

### ⚠ Caution

#### 1. Read the operation manual before mounting the product.

Read the operation manual carefully and understand the contents before mounting the product. The manual should also be kept where it can be referred to whenever necessary.

#### 2. Confirm the mounting orientation of the product.

Mount the pump on a horizontal surface only. Mount the product so that the reset button faces upward. (Refer to Figure 1) There are 4 mounting holes with M8 threads. Ensure that the product is mounted with 4 screws. The product can also be held by M6 hexagon socket head cap screws (4pcs.) by removing the resin cover as shown in Fig.2. (Refer to Figure 3) In this case, the M8 threads are considered as through holes.

Ensure that the resin cover is remounted correctly after mounting the pump.

Also, secure all specified mounting positions when using the product.

If the propagation of the vibration of the pump is not acceptable, insert vibroisolating rubber when mounting.

### 3. Piping

#### Caution

##### 1. Flush the piping.

Flush and clean the piping before connecting the product. Any dirt or scale and the like left in the piping may cause malfunction or failure.

##### 2. Tighten screws with proper tightening torque.

When screwing fittings into the product, tighten them with proper tightening torque as shown below. If loose, liquid or air leakage may occur. If overtightened, the threaded parts may be damaged.

Connection thread	Proper tightening torque [N·m]	Port names
Rc, NPT, G, NPTF 1/4"	12 to 14	AIR SUP, AIR EXH
Rc, NPT, G, NPTF 1/4"	12 to 14	FLUID IN, FLUID OUT
Rc, NPT, G, NPTF 3/8"	22 to 24	

### 4. Air supply

#### Warning

##### 1. Use clean air.

Do not use compressed air that includes chemicals, synthetic oils containing organic solvents, salinities or corrosive gases, etc., as it can cause damage or malfunction.

##### 2. Pay attention to avoid freezing when operating the product in low temperatures.

The equipment operates while expanding the compressed air. During this time, the temperature inside the product decreases due to adiabatic expansion. If the ambient temperature is low, using compressed air containing a lot of moisture may cause freezing because heat cannot be gained from the surroundings. In this case, take freeze prevention measures by using a membrane air dryer (such as series IDG).

#### Caution

##### 1. Quality of operating air

- Be sure to use only air filtrated by a micro mist separator (such as AMD series). Use of a super mist separator (such as AME series) is recommended to extend maintenance intervals.
- Use of humid air may cause condensation inside the body. Use air which has been treated by a refrigerated air dryer (such as IDF series).
- If a pump is operated by N<sub>2</sub> gas, etc., the deterioration of the gaskets inside the switching valve will be accelerated and may result in substantially shortening the life span of the product.

##### 2. Compressed air with low dew point

If compressed air with an atmospheric pressure dew point below -40°C is used, the lubrication properties inside the product can deteriorate prematurely, affecting the life of the product.

When air with an atmospheric pressure dew point below -40°C is used for the operating environment or operating fluid, it is recommend that the customer tests the product under their own specific operating conditions.

## 5. Operating Environment

### Warning

#### 1. Do not use in the following environments, as this can cause failure.

- 1) Locations with an atmosphere of corrosive gases, organic solvents or chemical solutions, and where there may be contact with the same.
- 2) Locations where there is contact with sea spray, water or steam.
- 3) Locations where ultraviolet deterioration or overheating of resin may occur due to direct sunlight.
- 4) Locations near heat sources with poor ventilation (heat sources should be shielded by heat insulating material).
- 5) Locations with impact or vibration.
- 6) Locations with excessive moisture and dust.

#### 2. The product cannot be used under water.

Do not use the product immersing it in water (liquid). Otherwise, liquid will enter the openings inside the product, resulting in a malfunction.

#### 3. Depending on the fluid used, a flammable atmosphere may occur. Take countermeasures such as ventilation.

## 6. Maintenance

### Warning

#### 1. Perform maintenance after consulting the operation manual.

Obtain the operation manual for the equipment from SMC or our distributor and have sufficient knowledge of the equipment before performing maintenance. Incorrect handling may cause damage or malfunction of the equipment or system.

#### 2. Perform maintenance work after confirming the safety of the system.

Turn off the compressed air and power supply and exhaust any remaining compressed air in the system before removing the equipment and the compressed air supply/exhaust unit. Discharge the residual liquid or sufficiently displace it as necessary. Also, when reinstalling the equipment or restarting it after replacement, confirm the safety of the product before checking that it operates normally.

#### 3. Use appropriate protective equipment.

When touching the process pump for maintenance, wear protective equipment such as gloves which are compatible with the fluid used. There is a risk of chemical burns.

#### 4. Do not disassemble the product, as disassembly will invalidate the product's warranty.

#### 5. Drain discharge

Operating the system with drain accumulated in the equipment or piping may cause a malfunction of the equipment, splash over into the downstream side, or unexpected accident. Periodically discharge drain from components including the air filter.

#### 6. Caution when transferring a high-temperature fluid

The product itself will become hot due to the high-temperature fluid. Since touching the product directly may cause burns, allow sufficient time for the product to cool down when transferring a high-temperature fluid. The measurement of the product temperature is recommended to confirm the safety of the system before performing work.

## Caution

### 1. Caution when transferring a highly penetrating liquid

When transferring a liquid that is highly penetrating through fluoropolymer, components of the transferred liquid may enter the openings inside the equipment. Also, they may become attached to the external surface of the equipment. In this case, take the same measures as handling the transferred liquid.

### 2. Service life of diaphragm and maintenance of consumable items

- If the operating cycle of the process pump exceeds the service life of diaphragm, the diaphragm may be damaged due to deterioration. If it is damaged, the fluid will leak from the pilot air exhaust port and the air will blow out into the liquid circuit. Consider the pump operation (breathing, decline of discharge pressure, etc.) and the reference service life of diaphragm, and replace with new process pump or conduct necessary maintenance as early as possible.
- Items such as check valves, switching valves and pilot valves may experience a malfunction earlier than the diaphragm depending on the operating conditions. Replacement of the whole product or maintenance should be performed as soon as possible.
- When conducting maintenance, obtain the necessary parts indicated in the maintenance parts list (P.20), and perform work according to the maintenance and operation manuals.

### 3. Please understand the following concerning the inability to repair the product.

- To enable the process pump to be used with various fluids, please note that from the aspects of ensuring worker safety and also the facilities, SMC is unable to carry out repair.

#### [Calculation of reference service life (days) of diaphragm]

$$\text{Reference service life (days)} = \frac{A \text{ (Amount of discharge per cycle)} \times B \text{ (Reference number of cycles in service life)}}{\text{Flow rate (L/min)} \times \text{Operating time per day (hour)} \times 60 \text{ (min)}}$$

Model	Operating Method	Diaphragm material	Amount of discharge per cycle A	Reference number of cycles in service life B	Volume inside pump (wetted part)
PAX1□12	Automatically operated	PTFE	Approx. 0.021L	50 million cycles	Approx. 90mL

## 7. Lubrication

### Caution

#### 1. The pump can be used without lubrication.

#### 2. If lubricating the pump, continue lubrication.

If lubricating a pump, use turbine oil Class 1 (with no additives) ISO VG32, and be sure to continue lubricating the pump.

For the manufacturer and brand of turbine oil Class 1 (with no additives), please refer to the SMC website.

## 8. Caution on Handling

### Warning

#### 1. Test before using with the actual equipment.

Test the pump before using it with the actual equipment. Even if there is no problem in a short-term test, the liquid may penetrate through the fluoropolymer diaphragm causing a malfunction in the pump air circuit.

#### 2. Storage

In the case of long-term storage after use, first thoroughly remove the liquid, and clean and dry the inside to prevent deterioration of the pump materials.

#### 3. After a long period of non-use, perform a trial run prior to operation.

#### 4. Ensure that the bolts are not loose before operating the process pump.

#### 5. Adjustment of the discharge amount

Connect the discharge volume adjustment valve (throttle) to the FLUID OUT port of the process pump. Adjust the volume by adjusting the opening of the valve.

#### 6. When the discharge volume is large (flow velocity is high) depending on the fluid type and operating conditions, cavitation may lead to poor operation or failure. Increase supply air pressure or decrease the discharge volume with a throttle so that cavitation is not generated.

#### 7. Operating environment

When dangerous fluid is used, take measures to isolate humans from the pump. External leakage of pumping fluid could cause serious injury.

#### 8. Countermeasures against liquid leakage

There are some cases where the operating fluid will leak outside the pump, for example when the diaphragm reaches the end of the life. Measures should be taken to avoid leakage, such as installing a drain pan, so that people and equipment will not be adversely affected.

#### 9. Caution for piping of the tube

Support the piping according to JIS B 8370 when piping the tube. Arrange the piping so that tension is not applied to the tube.

## 9. Return of Product

### Warning

If the product to be returned is contaminated or is possibly contaminated with substances that are harmful to humans, for safety reasons, please contact SMC beforehand and then employ a specialist cleaning company to decontaminate the product. After the decontamination prescribed above has been carried out, submit a Product Return Request Sheet or the Detoxification/Decontamination Certificate to SMC and await SMC's approval and further instructions before attempting to return the item.

Please refer to the International Chemical Safety Cards (ICSC) for a list of harmful substances.

## Applicable Fluids

### Material and Fluid Compatibility Check List for Process Pumps

- The data below is prepared based on data provided by the material manufacturers.
- SMC assumes no responsibility for the accuracy of the data or for any damages arising from the data.
- The material and fluid compatibility check list provides reference values as a guide only; therefore SMC does not guarantee the application to our product.

### Caution

- Select the wetted parts materials according to the transfer liquid you use to determine the model.
  - For the liquid contact areas, aluminum is suitable for oils, and stainless steel is suitable for solvents and industrial water.
  - For the diaphragm material, PTFE is suitable for non-permeating liquids.
  - Use fluids that will not corrode the wetted parts materials.
- These products are not suitable for medical or food use.
- The applicability may vary depending on additives. Take note also of additives.
- The applicability may vary depending on impurities. Take note also of impurities.
- Examples of transfer liquids are shown below. Since the applicability may vary depending on your operating conditions, be sure to check it by means of experimentation.
- Compatibility is indicated for fluid temperatures specified for the respective products (60°C or less).

Table symbols ○: Can be used. ×: Cannot be used. —: Can be used under certain conditions.

Model		PAX1112	PAX1212	
Body material		ADC12	SCS14	
Diaphragm material		PTFE		
Examples of applicable liquids	Water	Tap water	×	
		Pure water	×	
	Oil	Turbine oil	○	
		Cutting oil	○	
		Brake oil	○	
	Solvent	Flux	×	○
		Toluene	○ <sup>Note 1)</sup>

	Alkalis		×	
Metal corrosive liquid		×		
Highly permeating liquid		×		
Highly penetrating liquid		×		

Note 1) Static electricity may be generated. Take measures to prevent static electricity.

### Caution

#### Caution for transferring highly penetrating liquids

Do not use liquids which are highly penetrating to fluorine resin. This may cause internal damage to the process pump or liquid leakage.

## Specifications

Model		PAX1112	PAX1212
Actuation		Automatically operated	
Port size	Main fluid suction discharge port	Rc, NPT, G, NPTF 1/4, 3/8" Female thread	
	Pilot air supply/exhaust port	Rc, NPT, G, NPTF 1/4" Female thread	
Material	Body wetted areas	ADC12	SCS14
	Diaphragm	PTFE	
	Check valve	PTFE, SCS14	
Discharge rate		0.5 to 10 L/min	
Average discharge pressure		0 to 0.6 MPa	
Pilot air pressure		0.2 to 0.7 MPa	
Air consumption		150 L/min (ANR) or less	
Suction lifting range	Dry	Up to 2 m (when the pump is dry)	
	Wet	Up to 6 m (when the pump is primed)	
Noise		84 dB (A) or less (Option: with silencer, AN20)	
Withstand pressure		1.05 MPa	
Diaphragm life*		50 million times ( For water)	
Fluid temperature		0 to 60°C (No freezing)	
Ambient temperature		0 to 60°C (No freezing)	
Maximum viscosity		1000 mPa·s	
Weight		2.0 kg	3.5 kg
Mounting orientation		Horizontal (with mounting foot at bottom)	
Packaging		General environment	

\* These are reference values for room temperature and fresh water. These are not guaranteed. For details, refer to page 13.

# Performance Curve

## Flow Rate Characteristics

### Selection from Flow Rate Characteristic Graph

Required specifications example:

Find the pilot air pressure and pilot air consumption for a discharge rate of 6 L/min and a discharge pressure of 0.25 MPa. <The transfer fluid is fresh water (viscosity 1 mPa·s, specific gravity 1.0).>

\* If the total lifting height is required instead of the discharge pressure, a discharge pressure of 0.1 MPa corresponds to a total lift of 10 m.

Selection procedures:

1. First mark the intersection point for a discharge rate of 6 L/min and a discharge pressure of 0.25 MPa.
2. Find the pilot air pressure for the marked point. In this case, the point is between the discharge curves (solid lines) for SUP = 0.2 MPa and SUP = 0.5 MPa, and based on the proportional relationship to these lines, the pilot air pressure for this point is approximately 0.45 MPa.
3. Next find the air consumption. Since the marked point is below the curve for 50 L/min (ANR), the maximum rate will be about 45 L/min (ANR).

### **Caution**

1. These flow rate characteristics are for fresh water (viscosity 1 mPa·s, specific gravity 1.0).
2. The discharge rate differs greatly depending on properties (viscosity, specific gravity) of the fluid being transferred and operating conditions (lifting range, transfer distance), etc.
3. Use 0.75 kW per 100 L/min of air consumption as a guide for the relationship of the air consumption to the compressor.

## Viscosity Characteristics

### Selection from Viscosity Characteristic Graph

Required specifications example:

Find the pilot air pressure and pilot air consumption for a discharge rate of 2.7 L/min, and a viscosity of 100 mPa·s.

Selection procedures:

1. First find the ratio of the discharge rate for fresh water when viscosity is 100 mPa·s from the graph below. It is determined to be 45%.
2. Next, in the required specification example, the viscosity is 100 mPa·s and the discharge rate is 2.7 L/min. Since this is equivalent to 45% of the discharge rate for fresh water,  $2.7 \text{ L/min} \div 0.45 = 6 \text{ L/min}$ , indicating that a discharge rate of 6 L/min is required for fresh water.
3. Finally, find the pilot air pressure and pilot air consumption based on selection from the flow characteristic graphs.

### **Caution**

Viscosities up to 1000 mPa·s can be used.

The following equation shows the relationship between the kinematic viscosity and the dynamic viscosity.

$$\text{Kinematic viscosity } \nu \text{ [m}^2\text{/s]} = \frac{\text{Viscosity } \mu \text{ [Pa}\cdot\text{s}]}{\text{Density } \rho \text{ [kg/m}^3\text{]}}$$

The commonly used unit system is

$$\text{Kinematic viscosity } \nu \text{ [cSt]} = \frac{\text{Viscosity } \mu \text{ [mPa}\cdot\text{s}]}{\text{Density } \rho \text{ [g/cm}^3\text{]}}$$

In addition, 1 [mPa·s] = 1 [cP].

## Pulsation Attenuating Capacity

The process pump generates pulsation because it discharges a liquid using two diaphragms. The pulsation attenuator absorbs pressure when discharge pressure increases, and compensates the pressure when discharge pressure decreases. By this means pulsation is controlled.

## Maintenance Parts

- Basically, it is not recommended to disassemble the process pump. However, if this is necessary, be sure to follow the instructions in the maintenance procedure.
- When carrying out this work, wear appropriate protective equipment.

Description	PAX1 □ 12
Diaphragm kit	KT-PAX1-31
Check valve kit	KT-PAX1-36
Switching valve parts kit	KT-PAX1-37#1
Pilot valve kit	KT-PA5-38
Pulsation attenuator control valve kit	KT-PAX1-39
